

Ultra-flexible Product Development

The wire processing market has had one of its most serious crises ever this past year. Volume sales have plunged, especially in the automotive sector, and structures have had to be adjusted accordingly in many places. In situations like these, it is crucial to keep looking forward and pushing innovations in the products of the future, but that is not always a matter of course.

Under these circumstances, Komax is all prouder to present a number of innovations again at Productronica 2009. Our new innovative product features build on established advances to make proven and reliable equipment even better. As always, we focus on generating even more benefits for our customers with our new products.

In general, there are four main trends right now for which Komax is presenting innovations:

- 1. Miniaturization: The Komax machines have been newly developed to allow the processing of even smaller sized cables, particularly for insertion in miniaturized housings.*
- 2. Quality optimization: A new generation of crimp force analysis combines quality with high production output. This feature provides help in determining the optimum setting parameters and in detecting setup errors.*
- 3. More flexibility: The new fully automatic crimping machines are fitted with optimized open-ended interfaces so they can flexibly accommodate the addition of other processing modules at any time.*
- 4. Larger production output: Komax strives to boost the performance of existing products while making them easier for users to operate.*

The new products have benefited overall from the high level of flexibility in modern product development. We consider it crucial to show all our customers these new features. You are warmly invited to visit our stand at the Productronica in Munich. We consider our contact with you to be vitally important.
