

## Touchscreen control

Simple and intuitive touch screen control that is so easy to use

*A new feature of the Alpha 355 and the Gamma 263 machines is that you can now control them from a touch screen. You simply type on the screen directly with your finger or an appropriate stylus instead of using a mouse and keyboard. This makes machine operations much easier and seemingly more intuitive.*

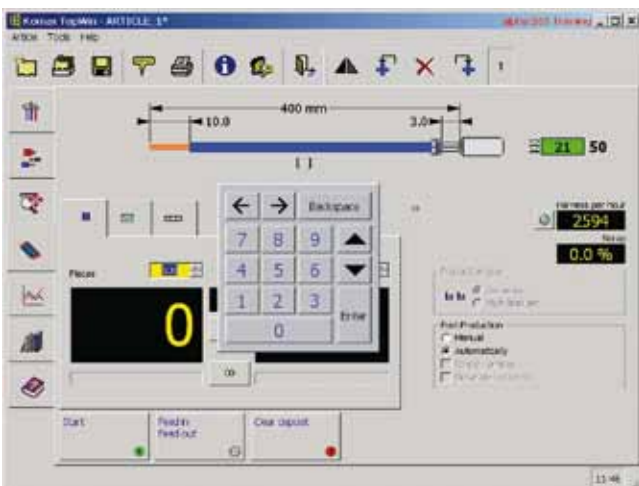

**Mirko Bulinsky** Product Manager

Touchscreen control

You keep using the reliable TopWin graphical user interface, so no additional training is required. If you wish, you can continue to use mouse and keyboard and combine both methods as desired.

When you are typing the number for the wire length, a ten-number keypad appears automatically, allowing you to type in the new length directly. Things could not be easier. You will probably continue to resort to mouse and keyboard for special machine setup functions such as defining wait times in relationship to wire length or entering texts. The requirement is that at least TopWin version 10.3 is in operation.

TopWin version for touchscreen

### YOUR BENEFITS

- Operate the machine with your finger or a stylus
- Even greater user friendliness
- Same reliable graphical user interface
- Screen content easier to read because the controls and fonts were enlarged
- No additional training required
